1. GENERAL WARNING

1.1 PLEASE READ BEFORE USING THIS MANUAL

- This manual is part of the product and should be kept near the instrument for easy and quick reference.
- The instrument shall not be used for purposes different from those described herein. It cannot be used as a safety device.
- Check the application limits before proceeding.

1.2 SAFETY PRECAUTIONS

- Check the supply voltage is correct before connecting the instrument.
- Do not expose to water or moisture: use the controller only within the operating limits avoiding sudden temperature changes with high atmospheric humidity to prevent formation of condensation.
- Warning: disconnect all electrical connections before any kind of maintenance.
- Fit the probe where it is not accessible by the End User. The instrument must not be opened.
- In case of failure or faulty operation send the instrument back to the distributor or to “Dixell s.r.l.” (see address) with a detailed description of the fault.
- Consider the maximum current which can be applied to each relay (see Technical Data).
- Ensure that the wires for probes, loads and the power supply are separated and far enough from each other, without crossing or intertwining.
- In case of applications in industrial environments, the use of mains filters (our mod. FT1) in parallel with inductive loads could be useful.

2. GENERAL DESCRIPTION

Model XR40C, 32x74 mm format, is a microprocessor based controller, suitable for applications on medium or low temperature refrigerating units. It has 2 relay outputs to control compressor and defrost, which can be either electrical or reverse cycle (hot gas). It is also provided with two NTC or PTC probe inputs, one for temperature control, the other, to be located onto the evaporator, to control the defrost termination temperature. The instrument is fully configurable through special parameters that can be easily programmed through the keyboard.

3. CONTROLLING LOADS

3.1 COMPRESSOR

The regulation is performed according to the temperature measured by the thermostat probe with a positive differential from the set point value again.

3.2 DEFROST

Two defrost modes are available through the “tdF” parameter: defrost through electrical heater (tdF = EL) and hot gas defrost (tdF = in). Other parameters are used to control the interval between defrost cycles (IdF), its maximum length (MdF) and two defrost modes: timed or controlled by the evaporator’s probe (P2P). At the end of defrost dripping time is started, its length is set in the FST parameter. With FST = 0 the dripping time is disabled.

4. FRONT PANEL COMMANDS

4.1 USE OF LEDS

<table>
<thead>
<tr>
<th>LED MODE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
</tr>
<tr>
<td>OFF</td>
</tr>
<tr>
<td>Flashing</td>
</tr>
</tbody>
</table>

Each LED function is described in the following table.

4.2 SET TO display target set point; in programming mode it selects a parameter or confirms an operation.

5. TEMPERATURE ALARM AND ITS DURATION RECORDING (HACCP)

XR40C signals and records temperature alarms, together with their duration and max value reached. See drawing:

5.1 HOW TO SEE THE ALARM DURATION AND MAX (MIN) TEMPERATURE

If the alarm LED is on, an alarm has taken place.

To see the kind of alarm, the max (min) reached temperature and alarm duration do as follows:
1. Push the Up or Down key.
2. On the display the following message is shown:
   - “HAL” for high temperature alarm (“LAL” for the minimum alarm), followed by the Maximum (minimum) temperature.
   - Then the “tIM” (TIME) message is displayed, followed by the “dUR” in m.m.
3. Then the instrument displays the temperature once again.

NOTE1: if an alarm is still occurring the “tIM” shows the partial duration.
NOTE2: the alarm is recorded when the temperature come back to normal values

5.2 HOW TO RESET A RECORDED ALARM OR ONE THAT IS STILL OCCURRING

1. Hold the SET key pressed for more than 3s, while the recorded alarm is displayed. (the RST message will be displayed)
2. To confirm the operation, the “RST” message starts blinking and the normal temperature will be displayed.

6. MAIN FUNCTIONS

6.1 HOW TO SEE THE SETPOINT

1. Push and immediately release the SET key: the display will show the Set point value;
2. Push and immediately release the SET key or wait for 5 seconds to display the probe value again.
6.2 HOW TO CHANGE THE SETPOINT
1. Push the SET key for more than 2 seconds to change the Setpoint value:
2. The value of the set point will be displayed and the LED starts blinking;
3. To change the Set value press the ▲ or ▼ arrows within 10s.
4. To memorise the new set point value push the SET key again or wait 10s.

6.3 HOW TO START A MANUAL DEFROST
Push the DEF key for more than 2 seconds and a manual defrost will start.

6.4 HOW TO CHANGE A PARAMETER VALUE
To change the parameter’s value operate as follows:
1. Enter the Programming mode by pressing the Set and DOWN key for 3s (LED 1 and LED start blinking).
2. Select the required parameter.
3. Press the “SET” key to display its value (now only the LED is blinking).
4. Use “UP” or “DOWN” to change its value.
5. Press ‘SET’ to store the new value and move to the following parameter.

NOTE: the set value is stored even when the procedure is exited by waiting the time-out to expire.

6.5 THE HIDDEN MENU

6.5.1 HOW TO ENTER THE HIDDEN MENU
1. Enter the Programming mode by pressing the Set + ▼ key for 3s (LED 1 and LED start blinking).
2. When a parameter is displayed keep pressed the Set ↓ key, till the parameter is displayed immediately followed from the HY parameter.

NOTE: the parameters preceded by dots are in the Hidden Menu.

6.5.2 HOW TO MOVE A PARAMETER FROM THE HIDDEN MENU TO THE FIRST LEVEL AND VICEVERSA
Each parameter present in the HIDDEN MENU can be moved or put into “THE FIRST LEVEL” (user level) by pressing “SET + ▼”.

In HIDDEN MENU when a parameter is present in First Level the decimal point is on.

6.6 HOW TO LOCK THE KEYBOARD
Keep pressed together for more than 3s the ▲ and ▼ keys, till the “Pon” message will be displayed.

6.7 TO UNLOCK THE KEYBOARD
Keep pressed together for more than 3s the ▲ and ▼ keys, till the “Pon” message will be displayed.

6.8 THE CONTINUOUS CYCLE
When defrost is not in progress, it can be activated by holding the “↓” key pressed for about 3 seconds.

The compressor operates in continuous mode for the time set through the “CCt” parameter. The cycle can be terminated before the end of the set time using the same activation key “↓” for 3 seconds.

7. PARAMETERS

NOTE: the parameters preceded by dots are in the Hidden Menu.

REGULATION

Hy Differential: (0.1 ÷ 25.5°C / 1÷235 °F) Intervention differential for set point. Compressor Cut In is Set Point Plus Differential (Hy). Compressor Cut Out is when the temperature reaches the set point.

- LS Minimum set point: (-50°C SET-58°F SET): Sets the minimum acceptable value for the set point.
- US Maximum set point: (SET+110°C SET+230°F): Set the maximum acceptable value for set point.

Ot Thermostat probe calibration: (-12.0÷12.0°C, -120÷120°F) allows to adjust possible offset of the thermostat probe.

P2F Evaporator probe presence: nO- not present: the defrost stops by time; yE- present: the defrost stops by temperature.

OE Evaporator probe calibration: (-12.0÷12.0°C, -120÷120°F), allows to adjust possible offset of the evaporator probe.

- OdS Outputs activation delay at start up: (0÷255min) This function is enabled at the initial start up of the instrument and inhibits any output activation for the period of time set in the parameter.
- ACo Anti-short cycle delay: (0.50 ÷ min) minimum interval between the compressor stop and the following restart.
- CCl Compressor ON time during continuous cycle: (0.0÷24.0h; res. 10min) Allows to set the length of the continuous cycle: compressor stays on without interruption for the CCl time. Can be used, for instance, when the room is filled with new products.
- COn Compressor ON time with faulty probe: (0÷255 min) time during which the compressor is active in case of faulty thermostat probe. With COn=0 compressor is always OFF.
- COF Compressor OFF time with faulty probe: (0÷255 min) time during which the compressor is OFF in case of faulty thermostat probe. With COf=0 compressor is always active.

DISPLAY

- CF Temperature measurement unit: (°C=Celsius; °F=Fahrenheit) WARNING: When the measurement unit is changed the SET point and the values of the parameters Hy, LS, US, Ot, AlU and ALL have to be checked and modified if necessary.
- res Resolution for °C: (in = 1°C; dE = 0.1°C) allows decimal point display.

- Lod Display: select which probe is displayed by the instrument: P1 = Thermostat probe; P2 = Evaporator probe

DEFROST

tdf Defrost type: EL = electrical heater; in = hot gas
tdE Defrost termination temperature: (-50÷8°C)

-58÷122°F (Enabled only when Edf=PB) sets the temperature measured by the evaporator probe, which causes the end of defrost.

tdF Interval between defrost cycles: (0÷120h) Determines the time interval between the beginning of two defrost cycles.

MdF Minimum length for defrost: (0÷255min) When P2P ≥ n, (not evaporator probe: timed defrost) it sets the defrost duration, when P2P = y (defrost end based on temperature) it sets the maximum length for defrost.

dSD Start defrost delay: (0÷99min) This is useful when different defrost start times are necessary to avoid overdrying the plant.

- dFDef Temperature displayed during defrost: (rt = real temperature; it = temperature at defrost start; SEI = set point; def = “DEF” label)

- dSD MAX display delay after defrost: (0÷255min). Sets the maximum time between the end of defrost and the restarting of the real room temperature display.

- Fdt Drip time: (0÷120 min) time interval between reaching defrost termination temperature and the restarting of the control’s normal operation. This time allows the evaporator to eliminate water drops that might have formed due to defrost.

- dPo First defrost after start-up: y = immediately; n = after the Fdt time

- dAP Defrost delay after continuous cycle (0÷23.5h) time interval between the end of the fast freezing cycle and the following defrost related to it.

ALARMS
- ALC Temperature alarms configuration: (Ab; rE)

- Ab= absolute temperature: alarm temperature is given by the ALL or AlU values.

rE= relative temperature: alarm temperature are referred to the set point. Temperature alarm is enabled when the temperature exceeds the “SET+ALU” or “SET-ALL” values.

- AUL Maximum temperature alarm: (SET+110°C; SET+230°F) when this temperature is reached the alarm is enabled, after the “ALd delay” time.

- ALL Minimum temperature alarm: (-50.0 ÷ SET°C; -58÷230°F when this temperature is reached the alarm is enabled, after the “ALd delay” time.

- ALo Temperature delay alarm: (0÷255 min) time interval between the detection of an alarm condition and alarm signalling.

- ADO Exclusion of temperature alarm at startup: (from 0.0 min to 23.5h) time interval between the detection of the temperature alarm condition after instrument power on and alarm signalling.

DIGITAL INPUT

- IFD Digital input polarity: pO; the digital input is activated by opening the contact; CL; the digital input is activated by closing the contact.

- IFd Digital input configuration: EAL = external alarm: “EA” message is displayed; DAL = serious alarm “CA” message is displayed. PAL = pressure switch alarm. “CA” message is displayed; dor = door switch function; def = defrost function of a defrost cycle; LH = not enabled; Hr = kind of action inversion (cooling – heating).

- dId: (0÷255 min)

- with IFd= EAL or IFd = DAL digital input alarm delay: delay between the detection of the external alarm condition and its signalling.

- with IFd= dor: door opening signalling delay

- with IFd = PAL: time for pressure switch function: time interval to calculate the number of the pressure switch activation.

- nPS Pressure switch number: (0÷15) Number of activation of the pressure switch, during the “did” interval, before signalling the alarm event (IFd= PAL). If the nPS activation in the did time is reached, switch off and on the instrument to restart normal regulation.

- rtc Compressor status when open door: no, Fan = normal; Cpr, Fc = Compressor OFF

OTHER

- Pbc Selection of probe: it allows to set the kind of probe used by the instrument. Pbc

- pBc PBC probe, nC= NTC probe

- dP1 First probe display

- dP2 Second probe display

- rEL Software release for internal use.

- Ptb Parameter table code: readable only.
8. DIGITAL INPUT

The free contact digital input is programmable in five different configurations by the “1IF” parameter.

8.1 DOOR SWITCH INPUT (1IF = dor)

It signals the door status and the corresponding relay output status through the “odc” parameter:

- **no**, Fan = normal (any change);
- **CF, F_C** = Compressor Output;

Since the door is opened, after the delay time set through parameter “did”, the door alarm is enabled, the display shows the message “dA” and the regulation restarts. The alarm stops as soon as the external digital input is disabled again. With the door open, the high and low temperature alarms are disabled.

8.2 GENERIC ALARM (1IF = EAL)

As soon as the digital input is activated the unit will wait for “did” time delay before signalling the “EAL” alarm message. The outputs status don’t change. The alarm stops just after the digital input is de-activated.

8.3 SERIOUS ALARM MODE (1IF = BAL)

When the digital input is activated, the unit will wait for “did” delay before signalling the “CA” alarm message. The relay outputs are switched OFF. The alarm will stop as soon as the digital input is de-activated.

8.4 PRESSURE SWITCH (1IF = PAL)

If during the interval time set by “did” parameter, the pressure switch has reached the number of activation of the “nPS” parameter, the “CA” pressure alarm message will be displayed. The compressor and the regulation are stopped. When the digital input is ON the compressor is always OFF.

If the nPS activation in the did time is reached, switch off and on the instrument to restart normal regulation.

8.5 START DEFROST (1IF = dFr)

It starts a defrost if there are the right conditions. After the defrost is finished, the normal regulation will restart only if the digital input is disabled otherwise the instrument will wait until the “Md” safety time is expired.

8.6 INVERSION OF THE KIND OF ACTION: HEATING-COOLING (1IF = H1r)

This function allows to invert the regulation of the controller: from cooling to heating and vice versa.

8.7 DIGITAL INPUTS POLARITY

The digital input polarity depends on the “1IF parameter. If “1IF=PL: the input is activated by closing the contact

8.8 INSTALLATION AND MOUNTING

Instrument XR40C shall be mounted on vertical panel, in a 23x71 mm hole, and fixed using the special bracket supplied.

To obtain an IP65 protection grade use the front panel with i1F=PAL

The temperature range allowed for correct operation is 0÷60 °C. Avoid places subject to strong vibrations, corrosive gases, excessive dust or humidity. The same recommendations apply to probes. Let air circulate by the cooling holes.

10. ELECTRICAL CONNECTIONS

The instrument is provided with screw terminal block to connect cables with a cross section up to 2.5 mm². Before connecting cables make sure the power supply complies with the instrument’s requirements. Separate the probe cables from the power supply cables, from the outputs and the power connections. Do not exceed 600 volts between the power supply and digital inputs. The maximum current allowed on each relay, in case of heavier loads use a suitable external relay.

10.1 PROBE CONNECTION

The probes shall be mounted with the bulb upwards to prevent damages due to casual liquid infiltration. It is recommended to place the thermostat probe away from air streams to correctly measure the average room temperature. Place the defrost termination probe among the evaporator fins in the coldest place, where most ice is formed, far from heaters or from the warmest place during defrost, to prevent premature defrost termination.

11. HOW TO USE THE HOT KEY

11.1 HOW TO PROGRAM A HOT KEY FROM THE INSTRUMENT (UPLOAD)

1. Program one controller with the front keypad.
2. When the controller is ON, insert the “Hot key” and push “uPL” key; the “uPL” message appears followed by flashing “End”.
3. Push “SET” key and the End will stop flashing.
4. Turn OFF the instrument remove the “Hot Key”, then turn it ON again.

NOTE: the “Err” message is displayed for failed programming. In this case push again “key if you want to restart the upload again or remove the “Hot key” to abort the operation.

11.2 HOW TO PROGRAM AN INSTRUMENT USING A HOT KEY (DOWNLOAD)

1. Turn OFF the instrument.
2. Insert a programmed “Hot Key” into the 5 PIN receptacle and then turn the Controller ON.
3. Automatically the parameter list of the “Hot Key” is downloaded into the Controller memory, the “dol” message is blinking followed by flashing “End”.
4. After 10 seconds the instrument will restart working with the new parameters.
5. Remove the “Hot Key”.

NOTE: the message “Err” is displayed for failed programming. In this case turn the unit off and then on if you want to restart the download again or remove the “Hot key” to abort the operation.

12. ALARM SIGNALS

<table>
<thead>
<tr>
<th>Message</th>
<th>Cause</th>
<th>Outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>P1</td>
<td>Room probe failure</td>

<td>All outputs OFF.</td>
</tr>
</tbody>
</table>

12.1 ALARM RECOVERY

Probe alarms “1P1” and “P2” start some seconds after the fault in the related probe; they automatically stop some seconds after the probe restarts normal operation. Check connections before replacing the probe. Temperature alarms “L/H” and “L/A” automatically stop as soon as the thermostat temperature returns to normal values and when defrost starts. Alarm “L/A” and “CA” (with i1F=PAL) recover as soon as the digital input is disabled.

Alarm “CA” (with i1F=PAL) recovers only by switching off and on the instrument.

13. TECHNICAL DATA

Housing: self extinguishing ABS.
Case: XR40C frontal 32x74 mm; depth 60 mm;
Mounting XR40C panel mounting in a 71x29mm panel cut-out
Protection: IP20.
Frontal protection: IP65 with frontal gasket (optional)
Connections: Screw terminal block ≤ 2,5 mm² wiring.
Power supply: according to the model: 12Vac/dc; ±10%; 24Vac/dc, ±10%; 230Vac ±10%; 50/60Hz, 110Vac ±10%, 50/60Hz
Power absorption: 3VA max
Display: 3 digits, red LED, 14,2 mm high.
Inputs: 2 NTC or PTC probes.
Digital input: free contact
Relay outputs: compressor: SPDT relay 8(3) A, 250Vac or SPST relay 20(8)A, 250Vac
defrost: SPDT relay 8(3) A, 250Vac
Data storage: on the non-volatile memory (EEPROM).
Kind of action: 1B. Pollution grade: normal; Software class: A.
Operating temperature: 0÷60 °C.
Storage temperature: ±30÷85 °C.
Relative humidity: 20÷85% (no condensing)
Measuring and regulation range:
- NTC probe: +40÷115°C (-40÷230°F)
- PTC probe: +50÷150°C (-55÷302°F)
Resolution: 0,1 °C or 1 °C ( selectable).
Accuracy (ambient temp. 25°C): ±0,7 °C ±1 digit.
